QUALITY ASSURANCE UNIT SUMMARY

Study: Standard Test Method for Efficacy of Sanitizers Recommended for Inanimate Non-Food Contact Surfaces

The objective of the Quality Assurance Unit is to monitor the conduct and reporting of non-clinical laboratory studies. This study has been performed in accordance to standard operating procedures and the study protocol. In accordance with Good Laboratory Practice regulation 40 CFR Part 160, the Quality Assurance Unit maintains a copy of the study protocol and standard operating procedures and has inspected this study on the date(s) listed below. Studies are inspected at time intervals to assure the integrity of the study. The findings of these inspections have been reported to Management and the Study Director.

Phase Inspected	Date of Phase Inspection	Date Reported to Study Director	Date Reported to Management
Critical Phase Audit: Contamination of Carriers	November 21, 2019	November 21, 2019	November 25, 2019
Final Report	November 27, 2019	November 27, 2019	November 27, 2019

STUDY REPORT

GENERAL STUDY INFORMATION

Study Title:

Standard Test Method for Efficacy of Sanitizers Recommended

for Inanimate Non-Food Contact Surfaces

Project Number:

A28826

Protocol Number:

ENV003110719.NFS.4

Sponsor:

Enviro Tech Chemical Services

500 Winmoore Way Modesto, CA 95358

Test Facility:

Analytical Lab Group-Midwest

1285 Corporate Center Drive, Suite 110

Eagan, MN 55121

TEST SUBSTANCE IDENTITY

Test Substance Name: Peraguard

Batch/Lot(s):

Lot JDNB6-12-1 and JDNB6-12-2

Manufacture Date(s):

November 7, 2019

Test Substance Characterization

Test substance characterization as to identity, strength, purity, stability and uniformity, as applicable, according to 40 CFR, Part 160, Subpart F (160.105), was documented prior to its use in the study. The Test Substance Certificate of Analysis Reports may be found in Attachments I-II.

STUDY DATES

Date Sample Received:

November 14, 2019

Study Initiation Date:

November 18, 2019

Experimental Start Date:

November 21, 2019 (Start time: 9:00 am)

Experimental End Date:

November 25, 2019 (End time: 1:00 pm)

Study Completion Date:

November 27, 2019

OBJECTIVE

The objective of this study was to determine the antimicrobial efficacy of sanitizers on hard, inanimate, non-porous, non-food contact surfaces. This method is in compliance with the requirements of the U.S. Environmental Protection Agency (EPA).

Page 8 of 33

SUMMARY OF RESULTS

Test Substance:

Peraguard (Lot JDNB6-12-1 and Lot JDNB6-12-2)

Dilution:

g/liter defined as 35.6 g test substance + 1 liter 400 ppm AOAC

Synthetic Hard Water

Test Organism(s):

Listeria monocytogenes (ATCC 19117)

Exposure Time:

5 minutes

Exposure Temperature:

Room temperature (19°C)

Organic Soil Load:

No organic soil load required

Efficacy Result:

Peraguard demonstrated efficacy of two out of two lots against Listeria monocytogenes, and therefore, meets the performance

requirements set forth by the U.S. EPA following a 5 minute exposure time at room temperature (19°C).

STUDY MATERIALS

Test System/Growth Media

Test Organism	Designation #	Growth Medium	Incubation Parameters
Listeria monocytogenes	19117	Brain Heart Infusion Broth	35-37°C, aerobic

The test organism(s) used in this study was/were obtained from the American Type Culture Collection (ATCC), Manassas, VA.

Recovery Media

Neutralizer:

D/E Neutralizing Broth + 0.01% Catalase

Agar Plate Medium:

Tryptic Soy Agar with 5% Sheep's Blood (BAP)

Reagents

Hard Water Description:

The Sponsor specified 400 ppm AOAC synthetic Hard Water was made using 12.0 mL of AOAC Solution I and 12.0 mL of AOAC Solution II. The total volume of the solution was brought to approximately 3 L using sterile deionized water. The synthetic hard water was prepared, titrated, and used for testing on the day of preparation. The actual titration result was 397 ppm.

Carriers

Glass 1" x 1" carriers were dipped in 95% alcohol, rinsed with deionized water, and air dried before sterilization. The carriers were placed into a vessel and sterilized in a hot air oven for ≥2 hours at ≥180°C. After sterilization, each carrier was placed into a sterile Petri dish.

Page 9 of 33

TEST METHOD

Preparation of Test Substance

An equivalent dilution of g/liter, defined as 35.6 g test substance + 1 liter diluent, was prepared using 3.56 g of the test substance and 100.0 mL of 400 ppm AOAC Synthetic Hard Water. The prepared test substance was allowed to mix for 5 minutes and was homogenous as determined by visual observation. The test substance was used within 30 minutes of preparation.

Preparation of Test Organism

From a stock slant no more than 5 transfers from original stock and ≤1 month old, an initial tube (10 mL) of culture broth was inoculated. This culture was termed the "initial broth suspension." From this initial broth suspension, a minimum of three daily transfers using 1 loopful (10 µL) of culture into 10 mL of culture media was performed on consecutive days prior to use as an inoculum. Each daily transfer was incubated at 35-37°C (36.0°C) for 24±2 hours using the appropriate growth medium. A 48-54 hour (48.0 hour) culture that was incubated at 35-37°C (36.0°C) was vortex-mixed and allowed to settle for ≥15 minutes. The upper 2/3rds of the culture was removed and transferred to a sterile vessel for use in testing. The culture was centrifuge concentrated at 3500 RPM for 10 minutes. A total of 12.0 mL of culture was concentrated to 6.0 mL. The culture was thoroughly mixed prior to use.

Contamination of Carriers

Sterile carriers were inoculated with 0.02 mL (20.0 µL) of culture using a calibrated pipettor spreading the inoculum to within approximately 3 mm of the edges of the carrier. The inoculated carriers were dried for 21 minutes at 35-37°C (36.0-36.1°C) and 40-41% relative humidity with the Petri dish lids slightly ajar and appeared visibly dry following drying. A constant humidity chamber was used in place of a desiccating chamber to ensure uniform humidification conditions and to overcome slow re-equilibration of a desiccator after opening.

Exposure Conditions

Following the completion of drying, each of the five test carriers were transferred to individual sterile 2 oz. (60 mL) polypropylene jars using sterile forceps with the inoculum facing up. Using staggered intervals, 5.0 mL of prepared test substance was transferred to each jar. The liquid completely covered the carriers during exposure. The carriers were allowed to expose at room temperature (19°C) and 35% relative humidity for 5 minutes. Following exposure, 20 mL of neutralizer was transferred to the jars using identical staggered intervals. The jars were vortex-mixed for 10-15 seconds to suspend the surviving organisms.

Test System Recovery

Within 30 minutes of neutralization, duplicate 1.00 mL and 0.100 mL aliquots of the neutralized solution (10°) were plated onto the recovery agar plate medium.

Incubation and Observation

The subculture plates were incubated at 35-37°C (36.0°C) for 48±4 hours (47.5 hours). The subcultures were placed at 2-8°C for 2 days prior to examination. Following incubation and storage, the subcultures were visually enumerated.

Page 10 of 33

STUDY CONTROLS

Carrier Population Control

Three inoculated, dried control carriers were treated as in the test procedure utilizing sterile deionized water in place of test substance. Following exposure, the carriers were neutralized as in the test and mixed as in the test. Ten-fold serial dilutions were prepared and duplicate 0.100 mL aliquots of the 10-1 through 10-4 dilutions were plated onto an appropriate agar. The plates were incubated as in the test procedure and enumerated. The acceptance criterion for this control is a minimum geometric mean value of 2.5 x 10⁴ CFU/carrier which is required to show a 99.9% reduction.

Carrier Sterility Control

Concurrent with testing, a representative, uninoculated carrier was added to the neutralizer. The vessel was mixed and 1.00 mL was plated onto appropriate agar and incubated. The acceptance criterion is a lack of growth following incubation.

Neutralizer Sterility

Concurrent with testing, a 1.00 mL aliquot of neutralizer was plated onto appropriate agar and incubated. The acceptance criterion is a lack of growth following incubation.

Culture Purity

A "streak plate for isolation" was performed on the organism culture and following incubation examined in order to confirm the presence of a pure culture. The acceptance criterion for this study control is a pure culture demonstrating colony morphology typical of the test organism.

Neutralization Confirmation Control

In a manner consistent with the AOAC 960.09 method, the neutralization confirmation control was performed concurrent with testing. The prepared test culture was serially diluted to target 2x10⁴ – 2x10⁵ CFU/mL (to target a result of 10-100 CFU plated in each control run). Multiple organism dilutions were prepared.

Test Culture Titer (TCT)

A 0.100 mL aliquot of diluted test organism was added to 25.0 mL of sterile diluent and vortex mixed. The mixture was held for a minimum of 30 minutes and was then spread plated utilizing duplicate 0.100 mL and 1.00 mL aliquots using the same method used in the test. The acceptance criterion for this study control is growth.

Neutralization Confirmation Control Treatment (NCT)

A sterile carrier was immersed (one per test organism dilution to be used, per test substance to be evaluated) in 5.0 mL of test substance as in the test. The sterile carrier was allowed to expose for the exposure time and each carrier was neutralized with 20 mL of neutralizer. The jar was vortex-mixed for 10-15 seconds. Within 5 minutes, a 0.100 mL aliquot of diluted test organism was added to the neutralized contents and vortex mixed. The mixture was held for a minimum of 30 minutes and was then spread plated utilizing duplicate 0.100 mL and 1.00 mL aliquots using the same method used in the test. The acceptance criterion for this study control is growth within 1 log₁₀ of the test culture titer (TCT) for at least one of the aliquots plated.

Page 11 of 33

Neutralizer Toxicity Treatment (NTT)

A 0.100 mL aliquot of diluted test organism was added to 25.0 mL of sterile neutralizer and was vortex mixed. The mixture was held for a minimum of 30 minutes and was then spread plated utilizing duplicate 0.100 mL and 1.00 mL aliquots using the same method used in the test. The acceptance criterion for this study control is growth within 1 log₁₀ of the test culture titer (TCT) for at least one of the aliquots plated.

Inoculum Count

The test organism was serially diluted and 0.100 mL aliquots of appropriate dilutions were plated in duplicate. The plates were incubated as in the test. This control is for informational purposes and therefore has no acceptance criterion.

STUDY ACCEPTANCE CRITERIA

Test Substance Performance Criteria

The efficacy performance requirements for label claims state that the test substance must demonstrate a minimum 99.9% reduction of test survivors as compared to the population control to be considered an effective non-food contact sanitizer.

Control Acceptance Criteria

The study controls must perform according to the criteria detailed in the study controls description section.

PROTOCOL CHANGES

Protocol Amendment(s):

No protocol amendments were required for this study.

Protocol Deviation(s):

No protocol deviations occurred during this study.

DATA ANALYSIS

Calculations

CFU/mL= (average CFU) x (dilution factor) (volume plated in mL)

Number of Organisms Surviving per Carrier

CFU/carrier = (average CFU) x (dilution factor) x (volume neutralized solution in mL) (volume plated or filtered in mL)

Geometric Mean of Number of Organisms Surviving on Test or Control Carriers Geometric Mean = Antilog of Log10X1 + Log10X2 + Log10XN

where:

X equals CFU/carrier N equals number of carriers

Percent Reduction

% reduction = [(a - b) / a] x 100

where:

geometric mean of the number of organisms surviving on the population control carriers.

b= geometric mean of the number of organisms surviving on the test carriers.

Recovery Log₁₀ Difference = Log₁₀ (Average CFU in TCT) – Log₁₀ (Average CFU in NCT or NTT) Used for the neutralization confirmation control

Statistical Methods

None used.

STUDY RETENTION

Record Retention

All of the original raw data developed exclusively for this study shall be archived at Analytical Lab Group-Midwest, 1285 Corporate Center Drive, Suite 110, Eagan, MN 55121 for a minimum of five years following the study completion date. After this time, the Sponsor (or the Sponsor Representative, if applicable) will be contacted to determine the final disposition. The original data includes, but is not limited to, the following:

- All handwritten raw data for control and test substances including, but not limited to, notebooks, data forms and calculations.
- Any protocol amendments/deviation notifications.
- All measured data used in formulating the final report.
- Memoranda, specifications, and other study specific correspondence relating to interpretation and evaluation of data, other than those documents contained in the final study report.
- Original signed protocol.
- Certified copy of final study report.
- Study-specific SOP deviations made during the study.

Test Substance Retention

The test substance will be discarded following study completion. It is the responsibility of the Sponsor to retain a sample of the test substance.

RESULTS

For Control and Neutralization Results, see Tables 1-4.

All data measurements/controls including the culture purity, neutralizer sterility, carrier sterility, neutralization confirmation and carrier population controls were within acceptance criteria.

For Test Results, see Tables 5-6.

ANALYSIS

Peraguard (Lot JDNB6-12-1 and Lot JDNB6-12-2), diluted g/liter, defined as 35.6 g of test substance + 1 liter 400 ppm AOAC Synthetic Hard Water, demonstrated a >99.99% reduction and a >99.99% reduction, respectively, of *Listeria monocytogenes* (ATCC 19117) following a 5 minute exposure time when tested at room temperature (19°C).

STUDY CONCLUSION

Under the conditions of this investigation, Peraguard, diluted g/liter, defined as 35.6 g of test substance + 1 liter 400 ppm AOAC Synthetic Hard Water, demonstrated efficacy against *Listeria monocytogenes* as required by the U.S. EPA following a 5 minute exposure time at room temperature (19°C).

In the opinion of the Study Director, there were no circumstances that may have adversely affected the quality or integrity of the data.

Standard Test Method for Efficacy of Sanitizers Recommended for Inanimate Non-Food Contact Surfaces

PURPOSE

The purpose of this study is to determine the antimicrobial efficacy of sanitizers on hard, inanimate, non-porous, non-food contact surfaces. This method is in compliance with the requirements of and may be submitted to, one or more of the following agencies as indicated by the Sponsor: U.S. Environmental Protection Agency (EPA) and Health Canada.

TEST SUBSTANCE CHARACTERIZATION

According to 40 CFR, Part 160, Subpart F [160.105] test substance characterization as to identity, strength, purity, solubility and composition, as applicable, shall be documented before its use in this study. The stability of the test substance shall be determined prior to or concurrently with this study. Pertinent information, which may affect the outcome of this study, shall be communicated in writing to the Study Director upon sample submission to Analytical Lab Group-Midwest. Analytical Lab Group-Midwest will append Sponsor-provided Certificates of Analysis (C of A) to this study report, if requested and supplied. Characterization and stability studies not performed following GLP regulations will be noted in the Good Laboratory Practice compliance statement.

SCHEDULING AND DISCLAIMER OF WARRANTY

Experimental start dates are generally scheduled on a first-come/first-serve basis once Analytical Lab Group-Midwest receives the Sponsor approved/completed protocol, signed fee schedule and corresponding test substance(s). Based on all required materials being received at this time, the <u>proposed</u> experimental start date is November 25, 2019. Verbal results may be given upon completion of the study with a written report to follow on the <u>proposed</u> completion date of December 23, 2019. To expedite scheduling, please be sure all required paperwork and test substance documentation is complete/accurate upon arrival at Analytical Lab Group-Midwest.

If a test must be repeated, or a portion of it, due to failure by Analytical Lab Group-Midwest to adhere to specified procedures, it will be repeated free of charge. If a test must be repeated, or a portion of it, due to failure of internal controls, it will be repeated free of charge. "Methods Development" fees shall be assessed, however, if the test substance and/or test system require modifications due to complexity and difficulty of testing.

If the Sponsor requests a repeat test, they will be charged for an additional test. Neither the name of Analytical Lab Group-Midwest nor any of its employees are to be used in advertising or other promotion without written consent from Analytical Lab Group-Midwest. The Sponsor is responsible for any rejection of the final report by the regulating agencies concerning report format, pagination, etc. To prevent rejection, Sponsor should carefully review the Analytical Lab Group-Midwest final report and notify Analytical Lab Group-Midwest of any perceived deficiencies in these areas before submission of the report to the regulatory agency. Analytical Lab Group-Midwest will make reasonable changes deemed necessary by the Sponsor, without altering the technical data.

JUSTIFICATION FOR SELECTION OF THE TEST SYSTEM

The U.S. Environmental Protection Agency requires that a specific claim for a sanitizer be supported by appropriate scientific data demonstrating the efficacy of the sanitizer against the claimed organism. In addition, if applicable, Health Canada requires that the product be recognized as a disinfectant prior to accepting sanitizer claims. This is accomplished in the laboratory by treating the target organism with the test substance under conditions which simulate as closely as possible, the actual conditions under which the test substance is designed to be used. For products intended for use on non-food contact surfaces, a carrier method is used in the generation of the supporting data. The test system to be used in this study follows the ASTM approved method for the evaluation of the antimicrobial efficacy of sanitizers on inanimate, nonporous, non-food contact surfaces.

TEST PRINCIPLE

A film of organism cells dried on a surface of appropriate carriers is exposed to the test substance for a specified exposure time. After exposure, the carriers are neutralized and assayed for survivors. Appropriate sterility, culture purity, carrier population, neutralization confirmation and inoculum count controls are performed. The current revision of Standard Operating Procedure CGT-0032 reflects the methods which shall be used in this study.

Page 3 of 11

TEST METHOD

Table 1:

Test Organism	Designation #	Growth Medium	Incubation Parameters
Listeria monocytogenes	19117	Brain Heart Infusion Broth	35-37°C, aerobic

The test organism(s) to be used in this study was/were obtained from the American Type Culture Collection (ATCC), Manassas, VA or equivalent.

<u>Subculture Agar</u>: Tryptic Soy Agar+5% Sheep's blood will be used in testing. The agar used in the test will be the same as that which is used in the control procedures which substantiates test organism recovery.

Carriers

Glass 1" x 1" carriers shall be dipped in 95% alcohol, rinsed with deionized water, and air dried before sterilization. The carriers will be placed into a vessel and sterilized in hot air oven for ≥2 hours at ≥180°C. After sterilization, each carrier will be placed into a sterile Petri dish.

Preparation of Test Organism

From a stock slant no more than 5 transfers from original stock and ≤1 month old, an initial tube (10 mL) of culture broth will be inoculated. This culture is termed the "initial broth suspension." From this initial broth suspension, at least three consecutive daily transfers using 1 loopful (10 µL) of culture into 10 mL of culture media will be performed prior to use as an inoculum. Incubate each daily transfer for 24±2 hours using the appropriate growth medium. The final test culture will be incubated for 48-54 hours.

A 48-54 hour culture will be vortex-mixed and allowed to settle for ≥15 minutes. The upper 2/3rds of the culture will be removed and transferred to a sterile vessel for use in testing. The culture may be adjusted by dilution in growth medium or by centrifuge concentration, if necessary. An organic soil load may be added to the test culture per Sponsor request. The test culture will be thoroughly mixed prior to use.

Preparation of Test Substance

The test substance will be prepared according to the directions for intended use of the product. The test substance shall be used within three hours of preparation if additional preparation is required by Analytical Lab Group-Midwest.

Contamination of Carriers

inoculate each sterile carrier with 0.02 mL (20 µL) of outture using a calibrated pipettor spreading the inoculum to within approximately 3 mm of the edges of the carrier. Dry the inoculated carriers for 20-40 minutes until visibly dry. A drying humidity should be selected to encourage maximum survival of the test organism (targeting approximately 40% humidity, for example). The lids may be left slightly alar or intact during drying if die-off is a concern. The drying conditions for organisms not defined in the ASTM method have been modified to ensure adequate recovery of the test organism. A constant humidity chamber will be used in place of a desiccating chamber to ensure uniform humidification conditions and to overcome slow re-equilibration of a desiccator after opening.

Drying Conditions: 35-37°C.

Page 24 of 33

Protocol Number: ENV003110719.NFS.4

Enviro Tech Chemical Services

Page 4 of 11

Exposure Conditions

Following the completion of drying, transfer each carrier to individual sterile 2 oz. (60 mL) polypropylene jars using sterile forceps with the inoculum facing up. Using staggered intervals, transfer 5.0 mL of prepared test substance to each jar. The liquid should completely cover the carrier during exposure. Continue treating the test carriers using staggered intervals. Allow the carriers to expose at the Sponsor specified exposure temperature for the Sponsor specified exposure time. Following exposure, transfer 20 mL of neutralizer to the jars using identical staggered intervals. Rotate the jar vigorously on an even plane for approximately 50 rotations to suspend the surviving organisms or vortex mix the jars for 10-15 seconds.

Test System Recovery

Within 30 minutes of neutralization, plate 1.0 mL and 0.1 mL aliquots of the neutralized subcultures (10°) in duplicate onto appropriate agar.

If neutralization of the test substance cannot be achieved chemically, filter-neutralization may be performed. Within 30 minutes of neutralization, transfer duplicate 1.0 mL and 0.1 mL of the neutralized solution, to individual filter units pre-wetted with 10 mL of sterile diluent. Evacuate the contents and rinse each filter with a minimum of 50 mL of sterile diluent. Transfer each filter to an appropriate agar using sterile forceps.

Incubation and Observation

All subcultures are incubated under the conditions listed in table 1 for 48±4 hours.

Following incubation, the subcultures will be visually enumerated. If necessary, the subcultures may be placed at 2-8°C for up to three days prior to examination.

Representative test plates showing growth may be subcultured, stained and/or biochemically assayed to confirm or rule out the presence of the test organism. If possible, subcultures containing 30-300 colonies will be used for calculations. When membrane filtration is used, the upper limit used for counting/calculations should be 200 CFU.

STUDY CONTROLS

Carrier Population Control

Inoculated, dried control carriers will be treated as in the test procedure utilizing sterile delonized water in place of test substance. If multiple exposure times were followed in testing, the carriers will be exposed for the shortest exposure time followed in the test procedure. Following exposure, the carriers will be neutralized as in the test. The carriers will be mixed as in the test. Ten-fold serial dilutions will be prepared and 0.1 mL aliquots of the 10⁻¹ to 10⁻⁴ dilutions will be plated in duplicate. The plates will be incubated as in the test procedure and enumerated. The acceptance criterion for this study control is a minimum geometric mean value of 2.5 x 10⁴ CFU/carrier which is required to show a 99.9% reduction and has been modified for test organisms not defined in the ASTM method.

Carrier Sterillty Control

Prior to testing, or concurrent with testing, a representative, uninoculated carrier will be added to the neutralizer. The vessel will be mixed and 1.0 mL will be plated onto appropriate agar and incubated. The acceptance criterion is a lack of growth following incubation.

Neutralizer Sterility

Prior to or concurrent with testing, a 1.0 mL aliquot of neutralizer will be plated onto appropriate agar and incubated. The acceptance criterion is a lack of growth following incubation.

Culture Purity

A "streak plate for isolation" will be performed on the organism culture and following incubation examined in order to confirm the presence of a pure culture. The acceptance criterion for this study control is a pure culture demonstrating colony morphology typical of the test organism.

Protocol Number: ENV003110719.NFS.4

Enviro Tech Chemical Services

Page 5 of 11

Organic Soil Sterility Control

i-mor to or concurrent with testing and ir appricable, the serum used for the organic soil load will be cultured, incubated, and visually examined for lack of growth. The acceptance criterion for this study control is lack of growth.

Neutralization Confirmation Control

in a manner consistent with the AOAC 960.09 method, the following neutralization confirmation control will be performed prior to testing or concurrent with testing. To represent worst-case conditions, only the most concentrated test substance dilution and/or shortest exposure time needs to be utilized in this control when multiple test substance concentrations or multiple exposure times are being evaluated in the study.

Serially dilute the prepared test culture to target 2x10⁴ – 2x10⁵ CFU/mL (to target a result of 10-100 CFU plated in each control run). Multiple organism dilutions may be prepared. (Typically the 10³, 10⁴ or 10⁵ dilutions will provide a culture in range depending on expected liter. Alternate or partial dilutions may be used where appropriate.) If all the organism dilution(s) used in this control fail to provide adequate numbers which coincides in a failure to meet the acceptance criterion for this study control, the control may be repeated in its entirety.

Test Culture Titer (TCT)

Add 0.1 mL of diluted test organism to 25 mL of sterile diluent and vortex mix. Hold the mixture for a minimum of 30 minutes and spread plate or filter plate duplicate 1.0 mL and 0.1 mL aliquots using the same method used in the test. The acceptance criterion for this study control is growth. If the test culture titer fails to yield countable numbers or if the culture titer is too low resulting in failing results, the entire neutralization confirmation control may be repeated in its entirety, as necessary, to properly validate neutralization.

Neutralization Confirmation Control Treatment (NCT)

Immerse a sterile carrier (one per test organism dilution to be used, per test substance to be evaluated) in 5.0 mL of test substance as in the test. Expose for the exposure time and neutralize each carrier with 20 mL of neutralizer. Rotate the jar vigorously on an even plane for approximately 50 rotations or vortex mix the jars for 10-15 seconds. Within 5 minutes, add 0.1 mL of diluted test organism to the neutralized contents and vortex mix. Hold the mixture for a minimum of 30 minutes and spread plate or filter plate duplicate 1.0 mL and 0.1 mL aliquots using the same method used in the test. The acceptance criterion for this study control is growth within 1 log₁₀ of the test culture titer (TCT) for at least one of the aliquots plated.

Neutralizer Toxicity Treatment (NTT)

Add 0.1 mL of diluted test organism to 25 mL of sterile neutralizer and vortex mix. Hold the mixture for a minimum of 30 minutes and spread plate or filter plate duplicate 1.0 mL and 0.1 mL aliquots using the same method used in the test. The acceptance criterion for this study control is growth within 1 log₁₀ of the test culture titer (TCT) for at least one of the aliquots plated.

Hold times after the addition of the test organism to the neutralization confirmation control vessels may be reduced if neutralization is a concern. Hold times followed should be as long or longer than the actual time required to plate the test carriers for a given test organism/test substance set.

Inoculum Count

Serially dilute and plate the test organism in duplicate using 0.1 mL aliquots and appropriate dilutions and incubate as in the test. This control is for informational purposes and therefore has no acceptance criterion.

ALC

PROCEDURE FOR IDENTIFICATION OF THE TEST SYSTEM

Analytical Lab Group-Midwest maintains Standard Operating Procedures (SOPs) relative to emicacy testing studies. Efficacy testing is performed in strict adherence to these SOPs which have been constructed to cover all aspects of the work including, but not limited to, receipt, log-in, and tracking of biological reagents including test organism strains for purposes of identification, receipt and use of chemical reagents. These procedures are designed to document each step of efficacy testing studies. Appropriate references to medium, batch number, etc. are documented in the raw data collected during the course of each study.

Additionally, each efficacy test is assigned a unique Project Number when the protocol for the study is initiated by the Study Director. This number is used for identification of the test subcultures, etc. during the course of the test. Test subcultures are also labeled with reference to the test organism, experimental start date, and test product. Microscopic and/or macroscopic evaluations of positive subcultures are performed in order to confirm the identity of the test organism. These measures are designed to document the identity of the test system.

METHOD FOR CONTROL OF BIAS: NO

STUDY ACCEPTANCE CRITERIA

Test Substance Performance Criteria

The efficacy performance requirements for label claims state that the test substance must demonstrate a minimum 99.9% reduction of test survivors as compared to the population control to be considered an effective non-food contact sanitizer.

Control Acceptance Criteria

The study controls must perform according to the criteria detailed in the study controls description section. If any control acceptance criteria are not met, the test may be repeated under the current protocol number.

If any portion of the protocol is executed incorrectly warranting repeat testing, the test may be repeated under the current protocol number. If the population control fails to meet the minimum requirement or if the neutralization control acceptance criteria is not met and the study fails to meet the efficacy requirements, repeat testing is not required.

REPORT

The report will include, but not be limited to, identification of the sample, date received, initiation and completion dates, identification of the organism strains used, description of media and reagents, description of the methods employed, tabulated results and conclusion as it relates to the purpose of the test, and all other items required by 40 CFR Part 160.185.

PROTOCOL CHANGES

If it becomes necessary to make changes in the approved protocol, the revision and reasons for changes will be documented, reported to the Sponsor and will become a part of the permanent file for that study. Similarly, the Sponsor will be notified as soon as possible whenever an event occurs that may have an effect on the validity of the study.

Standard operating procedures used in this study will be the correct effective revision at the time of the work. Any minor changes to SOPs (for this study) or methods used will be documented in the raw data and approved by the Study Director.

TEST SUBSTANCE RETENTION

It is the responsibility of the Sponsor to retain a sample of the test substance. All unused test substance will be discarded following study completion unless otherwise indicated by Sponsor.

RECORD RETENTION

Study Specific Documents

All of the original raw data developed exclusively for this study shall be archived at Analytical Lab Group-Midwest for a minimum of five years for GLP studies or a minimum of six months for all other studies following the study completion date. After this time, the Sponsor (or the Sponsor Representative, if applicable) will be contacted to determine the final disposition. These original data include, but are not limited to, the following:

- All handwritten raw data for control and test substances including, but not limited to notebooks, data forms and calculations.
- 2. Any protocol amendments/deviation notifications.
- All measured data used in formulating the final report.
- Memoranda, specifications, and other study specific correspondence relating to interpretation and evaluation of data, other than those documents contained in the final study report.
- Original signed protocol.
- 6. Certified copy of final study report.
- 7. Study-specific SOP deviations made during the study.

Facility Specific Documents

The following records shall also be archived at Analytical Lab Group-Midwest. These documents include, but are not limited to, the following:

- 1. SOPs which pertain to the study conducted.
- Non study-specific SOP deviations made during the course of this study which may affect the results obtained during this study.
- 3. Methods which were used or referenced in the study conducted.
- QA reports for each QA inspection with comments.
- Facility Records: Temperature Logs (ambient, incubator, etc.), Instrument Logs, Calibration and Maintenance Records.
- 6. Current curriculum vitae, training records, and job descriptions for all personnel involved in the study.

g. OECD Hard Water Preparation (If applicable)

Sterile OECD hard water will be prepared by adding 6.0 mL of European hard water stock solution A to approximately 600 mL of sterile delonized water. Eight (8.0) mL of European hard water stock solution B will be added. The total volume will be adjusted to 1000 mL using deionized water. (Equivalent dilutions may be made). The pH of the hard water will be adjusted to 7.0 ± 0.2. The prepared water must be used within 24 hours of preparation. On the day of test, the water will be titrated and must demonstrate 338-394 ppm hardness. Appropriate solution adjustments may be made to target the final hardness concentration.
